Digit Recognition

Eric Blohm

September 9, 2024

Here is the Python code for the digit recognition problem:

```
1
   import numpy as np
2
3
   #need input matrices as vectors => flatten. x has
       shape (5, 10, 16)
   def init_vectors(x):
4
5
       arr = x
6
       for i in range(0,len(x)):
7
            x[i] = np.array(x[i])
            x[i] = x[i].flatten()
8
9
            arr[i] = x[i]
10
       return arr
11
12
13
   #From the formula, eq 2.26
14
   def init_weight_matrix(x):
15
       N = len(x[0])
16
       W = np.zeros((N,N))
       for i in range(0, len(W)):
17
18
            for j in range(0, len(W[0])):
                if i == j:
19
20
                    W[i][j] = 0
21
                    continue
22
                sum_outer = 0
23
                for pattern in x:
24
                    sum_outer += pattern[i]*pattern[j]
25
                W[i][j] = (1/N)*sum_outer
26
       return W
27
28
29
   def classify(patterns, x_transformed):
30
       shape = (len(x_transformed),len(x_transformed[0]))
31
       for i in range(0,len(patterns)):
            patterns[i] = np.reshape(patterns[i],shape)
32
```

```
33
           if np.array_equiv(patterns[i], x_transformed):
34
               return i+1
35
           elif np.array_equiv(-patterns[i],
              x_transformed):
36
               return -(i+1)
37
       return 6
38
39
40
   def main():
41
       x1=[ [ -1, -1, -1, -1, -1, -1, -1, -1, -1, -1],[
